This protein comprises an immunoglobulin (Ig) C-gamma-3 region.
The invention provides a method for the production of tumour-
specific Ig derived from a B-cell lymphoma patient. In the novel
method expression plasmids containing the patient's VH region(s)
joined to either a C-gamma-3 (see AAT97188) or C-gamma-4 (see AAT97189)
cequence and expression plasmids containing the patient's VL
region(s) joined to either a C-kappa (see AAT97190) or C-lambda-2
cegion(s) joined to either a C-kappa (see AAT97190) or C-lambda-2
cegion(s) joined to either a C-kappa (see AAT97190) or C-lambda-2
cepion(s) joined to either a C-kappa (see AAT97190) or C-lambda-2
cepion(s) joined to since are cotransfected along with a selectable and
transfected cells are then subjected to selection and amplification.
The method permits the production of a multivalent vaccine which
reflects the degree of somatic variation found within the patient's
tumour. These novel multivalent vaccines provide superior vaccines
                                                                                                                                                                                                                                                                                                                                                                                                         1 APELLGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVQFKWYVDGVEVHNAKTK 60

The present sequence represents the constant region of human IgG isotype 3 (IgG3, C-gamma-3). C-gamma-3 and C-gamma-1 (see AAY1669) bind Fer receptors with high affainity, whereas C-gamma-4 (see AAX31672) has 10-fold lower binding affainity and C-gamma-2 (see AAX31672) has 10-fold lower binding affainity and C-gamma-2 (see AAX31670) does not bind to Fe receptor gamma-1. The invention of antibody-based fusion proteins with enhanced circulating half-lives. The fusion proteins lack the ability to bind to immunoglobulin Fc receptors, either as a consequence of the antibody isotype used for protein construction, i.e. a C-gamma-2 constant region (Fc) or a C-gamma-4 Fe receptor, or through directed mutagenesis of antibody isotypes that normally bind Fe receptors, i.e. C-gamma-1 or C-gamma-1 introduction of a mutation or a deletion at one or c-gamma-3. Introduction of a mutation or a deletion at one or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 APELLGGPSVFLFPPRPKDTLMISRTPEVTCVVVDVSHEDPEVQFKWYVDGVEVHNAKTK 60
                                                                                                                                                                                                                                                                       Or C-gamma-3. Introduction of a mutation or a deletion at one or note amino acid of C-gamma-3 selected from Leu281, Leu282, G1y284, Ann344, and Pro378, produces an ig heavy chain having reduced binding affinity for an Fc receptor. The methods protein such as a cytokine, e.g. tumour necrosis factor (TNF), an interleukin or a lymphokine such as a lymphotoxin or a colony stimulating factor, a ligand-binding protein, e.g. CD4, CTLA-4, TNF receptor or an interleukin receptor, or a protein toxin (claimed). The fusion proteins are used to deliver selectively the second non-1g protein to a target cell in vivo so that the second non-1g protein can exert a localised biological effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IgG antibody; light chain; Fc region; effector function; cancer; allergy; asthma; LFA-1-mediated disorder; tumour; cancer.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAB07474-78 represent native IgG Fc regions. The proteins are used to produce Fc region-containing polypeptides that have altered effector function as a consequence of one or more amino acid modifications in the Fc region. The variant polypeptides are useful for treating cancer, allergic conditions such as asthma (with an anti-1gE antibody), and LEA-1-mediated disorders. Where the polypeptide binds the HER2 receptor, the disorder preferably is HER2-expressing cancer, e.g. a hengn or malignant tumour characterized by overexpression of the HER2 receptor. Such cancers include breast cancer, aguamous cell cancer, small-cell lung cancer, non-small cell lung cancer, gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, badder cancer, hepatoma, colon cancer, colorectal cancer, endometrial carcinoma, salivary gland carcinoma, kidney cancer, liver cancer, prostate cancer, vulval cancer, hypoid cancer, hepatic carcinoma and various types of head and neck cancer.

This invention relates to non-naturally occurring peptide ligands which bind to the human erbB2 gene product ErbB2 (also known as HER2). Peptides represented in AAB76510 and AAB76432. AAB76509 are examples of the ErbB2 binding ligands of the invention. Sequences used in the lsolation of the peptides of the invention. The peptides compete for binding ErbB2 with naturally occurring ligands, and may be used to treat disorders characterized by over expression of HER2/ErbB2 such as cancers, diseases of the nervous system, musculature and epithelia, e.g. nervous system damage resulting from trauma, surgery, strokes, isoraemia, infection, metabolic disorders, nutritional deficiency or toxic agents. In particular the synthetic peptide ligands may be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, erbB2; HER2; cancer; nervous system disease; stroke; ischaemia; metabolic disorder; nutritional deficiency; Alzheimer's disease; Parkinson's disease; epilepsy; multiple sclerosis; Huntington's chorea; Down's syndrome; nerve deafiness; Meniere's disease; diabetic neuropathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Non-naturally occurring peptide ligands which compete for binding human erB2 gene products, useful for treating e.g. Alzheimer's disease, multiple sclerosis and diabetic neuropathy -

peptide ligand and an immunoglobulin (Ig) constant region multimerization domain (Ib). The hybrid molecules comprising the peptide ligands and their functional derivatives can be used in the same applications as, a peptide ligand can be used. For example the peptide ligand can bind ErbB2. The peptide ligand may bind to and inhibit the activity associated with a particular target molecule.
                                                                                                                                                                                                                                          ö

This vector represents the cloning of the human gamma isotype, gamma-3 with the variable region of the murine monoclonal antibody 128.1. This plasmid enrocles a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CH1, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector, pAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated. 128.1 is an anti-human transferrin receptor antibody which hinds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to prevent neurological disorders eg. brain tumours.
Alzheimer's disease, Parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease and neuropathy associated with diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pAH4602. This vector contains open reading frames encoding the heavy chain variable region (VH) of the antibody 128.1, an ampicillin resistance gene and a histidine (histidinol) selection marker.

Transcription of the VH gene is from the VH promoter of the murine 27.44 gene. The vector also includes a heavy chain immunoglobulin conhancer and the human gammal. Constant region (CH). The VH region of 128.1 was achieved by digesting the plasmid and the product with EcoRV and Nhel. The VH gene was inserted in frame with the human comman and CH region CH at the 3' end of the VH-J region by means of a Nhel site. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This can thibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AlbS, stroke, equilessy, parkinsons and Alzheimers disease. It may also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR41682-85 are encoded by the expression vector,

The invention provides immunoglobulin E (IgE) antagonists comprising one or more of the FcepsilonRI receptor-binding determinant sites of human ligE. The antagonists include IgE variants comprising an immunoglobulin template and binding determinant sequences (bds) CDbds, EFbds and the sequence shown in AAY42581. The CDbds (CD loop binding determinant sequence) are selected from the sequences shown in AAY42580. The sequences shown in AAY42567 v42577 and the EFbds (EF loop binding determinant sequence) are selected from sequences shown in AAY42578 v42580. The variants are useful in raising and screening anti-IgE antibodies, in the isolation and purification of FcepsilonRI receptor and in the treatment and prophylaxis of allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunoglobulin E variants as peptide antagonists useful for raising and screening anti-immunoglobulin E (IgE) antibodies, in the isolation and purification of FcepsilonRI receptor and in the treatment of allergic diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             used in creating a BLLE2-immunoglobulin FC fusion protein (BLE2/FC).

BLEP2 is a Epstein-Barr virus (BBV) protein. To create BLLE2/FC, this sequence, the leader sequence of mouse interleukin-7 (1L-7) (see

AARB7021), a Flag octapeptide (see AARB7022) and a flexible linker (see

AARB7024) are joined to the extracellular domain (residues 34 to 223) of

the BLLE2 sequence (see AARB7020). The BLLE2/FC fusion protein

containing this sequence is referred to in claim 4. BLE2 proteins

containing this sequence is referred to in claim 4. BLE2 proteins are

members of the C-type lectin family. The C-type lectin domain is found

in type II membrane proteins. The BLLE2 protein is capable of binding

the beta chain of a major histocompatibility complex (MHC) class II

antigen. Fusion proteins with an oligomerising zipper domain (OZD).

Instead of an immunoglobulin Fc region, can also be created. BLLE2

proteins inhibit antigen-specific antibody formation, proliferation of

blood mononuclear cells and cytotoxic T cell responses. They also

certified sclerosis and systemic lupus erythematosus. Also, for treating

allergy or asthma. They can be used for treating or preventing

allergy or asthma. They can be used for treating or preventing

allergy or asthma. They can be used for treating or preventing

allergy or sthma. They can be used for treating or preventing

clisease, especially EBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence was used in the preparation of a synthetic construct containing the Epstein-barr virus (BBV) BLLF2 protein, which is capable of binding a beta-chain of a major histocompatibility complex (MHC) class II antigen. The protein can be used to inhibit antigen-specific antibody formation, peripheral blood monouclear cell proliferation and cytotoxic T-cell responses, e.g. in the prevention or treatment of autoimmune diseases, transplant rejection, allergies or asthma,
                                                                                                                                                                                                                                                                                                                                                                                         complex class II beta chain, useful for treating, e.g. auto-immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BZLF2 protein; beta chain; blood mononuclear mononuclear cell; Class II major histocompatibility complex antigen; proliferation; cytotoxic T cell response; antigen specific response; asthma; autoimmune disease; transplant rejection.
                                                                                                                                                                                                                                                                                                                                                             Epstein-Barr virus protein - binds to major histocompatibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 568; DB 19; Length 212;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The human IgG1 Fc region (AAW02305) can be used as a fusion partner for interleukin-17 receptor (IL-17R) proteins (see also AAW04184-85), allowing purification of recombinant IL-17R using protein A or protein G affinity chromatography. Fusions between Fc and HVS13 (see also AAW02387), a viral homologue of IL-17, and between Fc and murine CTLA8 (AAW02386) were used to identify calls that express the murine IL-17R. Selected murine thymoma EL4 cells were used as a source of murine IL-17R cDNA (AAT33800).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 APELLGGPSVFLFPPKPKDTLMISRTPEVTCVVVDVSHEDPEVOFKWYVDGVEVHNAKTK 60

                                                                                                                               The present sequence represents a protein used to create fusion proteins with the Epstein-Barr virus BZLF2 proteins of the invention. The BZLF2 protein is capable of binding to a beta chain of a class II major histocompatibility complex antigen to inhibit an antigen-specific response. BZLF2 is useful for inhibiting antigen-specific antibody and cytotoxic T cell responses. BZLF2 is also useful for inhibiting undesirable antigen specific responses, e.g. in the treatment or prevention of asthma; for preventing or treating autoimmune disease; and for preventing tissue or organ transplant rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T cell proliferation; T cell activation; organ; graft; rejection; autoimmune disease; allergy; asthma; treatment; inflammatory disease; B cell proliferation; immunogen; IgG1; Fo.

                                 This sequence represents a human IgG1 Fc fragment which is used in the construction of a fusion protein with human interleukin-17 receptor (IL-17R). IL-17R polypeptides have immunoregulatory activity. They can be used for inhibiting T cell proliferation, or for inhibiting T cell activation. In particular they can be used for preventing or treating organ or graft rejection, autoimmune disease, allergy or asthma. They can also be used for the prevention or treatment of inflammatory disease in proliferation or immunoglobulin screttion. The IL-17 polypeptides can also be used as immunogens, reagents in in vitro assays, or as binding agents for affinity purification procedures.
                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Ig gamma 4 chain constant region - pig (fragment)

C;Species: Sus scrofa domestica (domestic pig)

C;Species: 21-Feb-1997 #sequence_revision 21-Feb-1997 #text_change 21-Jan-2000

C;Accession: 147162

R;Racskovics, I.; Sun, J.; Butler, J.E.

J. Immunol. 153, 3565-3573, 1994

A;Title: Five putative subclasses of swine IgG identified from the cDNA sequences of A;Reference number: 147163; MUID:95015845

A;Status: preliminary; translated from GB/EMBL/DDBJ

A;Molecule type: mRNA

A;Rossion: 1277 < KAC>

Sequence 30, Application US/08444644

Patent No. 601555
GENERAL INFORMATION:
GENERAL INFORMATION:
TILLE OF INVENTION: TRANSFERRIN RECEPTOR SPECIFIC
TITLE OF INVENTION: ANTIBODY-NEUROPHARMACEUTICAL OR DIAGNOSTIC AGENT
TITLE OF INVENTION: CONJUGATES
NUMBER OF SEQUENCES: 46
CORRESSONDENCES: 46
CORRESPONDENCES: 46
CORRESPONDENCES: Hamilton, Brook, Smith & Reynolds, P.C.
STREET: Two Militia Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                         OPERATING SYSTEM: PC-DOS/MS-DOS
